 I Restricted

 D Prohibited

Prior Report & Date: Annual -2003

SUMMARY

Although bacteriological water quality in Shellfish Growing Area 11 appears to be relatively stable, a shoreline survey and bacteriological data review indicate that classification changes are warranted. Fifteen of the twenty-six monitoring stations indicated slight statistical improvement in water quality (lower geometric means and/or estimated 90th percentile fecal coliform MPN values) from the 2003 annual report. The eleven remaining stations indicated a slight downward oscillation. The upland shores along the northern part of the Stono River, as well as along Bass Creek, Cinder Creek and Kiawah River all are being heavily developed. Stormwater runoff likely impacts water quality in these areas. The shoreline adjacent to the area between the Highway 700 Bridge (Station 02) and Penny's Creek (Station 27) was the primary focus of shoreline survey activities during 2003. A CPW wastewater treatment plant point source within the area has been inactivated. Due to the inactivation of this discharge, the portion of the Stono River between Buzzards Roost Marina and the Ross Marine facility will be upgraded to a Restricted classification

Additionally, the shoreline survey identified a significant amount of pasture and farm land throughout Johns Island. Two horse farms were noted in the area of Abbapoola Creek. The Division of Water Quality is performing a series of special samples throughout the length of Abbapoola Creek to help identify pollution sources. The area around Bass and Cinder Creek (stations 34 and 35) has shown water quality improvement during the three-year review period and, as a result, will be classified as Approved. The portion of the Atlantic Intracoastal Waterway between stations 15 and 17 will be downgraded from Approved to Restricted. All marinas will be surveyed prior to December 31, 2004 for site-specific closure zone sizing.

INTRODUCTION

PURPOSE AND SCOPE

The authority to regulate the harvest, sanitation, processing and handling of shellfish is granted to the South Carolina Department of Health and Environmental Control by Section 44-1-140 of the Code of Laws

of South Carolina, 1976, as amended. The Department promulgated Regulation 61-47, which provides the rules used to implement this authority and outlines the requirements applied in regulating shellfish sanitation in the State. This regulation specifically addresses classification of shellfish harvesting areas and requires that all areas be examined by sanitary and bacteriological surveys and classified into an appropriate shellfish harvesting classification.

The National Shellfish Sanitation Program (NSSP) Guide For The Control Of Molluscan Shellfish is used by the United States Food and Drug Administration (USFDA) to evaluate state shellfish sanitation programs. The NSSP Model Ordinance requires that a sanitary survey be in place for each growing area prior to its use as a source of shellfish for human consumption and prior to the area's classification as Approved, Conditionally Approved, Restricted, or Conditionally Restricted. Each sanitary survey shall be updated on an annual basis and accurately reflect changes which have occurred within the area. Requirement of the annual reevaluation include, at a minimum, field observations of pollution sources, an analysis of water quality data consisting of the past year's data in combination with appropriate previously collected data, review of reports and effluent samples from pollution sources, and review of performance standards for discharges impacting the growing area. A brief report documenting the findings shall also be provided.

The following criteria consistent with the NSSP Model Ordinance and S. C. Regulation 61-47 are used in establishing shellfish harvesting classifications:

Approved - Growing areas shall be classified Approved when the sanitary survey concludes that fecal material, pathogenic microorganisms, and poisonous or deleterious substances are not present in concentrations which would render shellfish unsafe for human consumption. The Approved area classification shall be designated based upon a sanitary survey, which includes water samples collected from stations in the designated area adjacent to actual or potential sources of pollution. For waters sampled under adverse pollution conditions, the median fecal coliform Most Probable Number (MPN) or the geometric mean MPN shall not exceed fourteen per one hundred milliliters, and not more than ten percent of the samples shall exceed a fecal coliform MPN of forty-three per one hundred milliliters (per five tube decimal dilution). For waters sampled under a systematic random sampling plan, the geometric mean fecal coliform Most Probable Number (MPN) shall not exceed fourteen per one hundred milliliters, and the estimated ninetieth percentile shall not exceed an MPN of forty three (per five tube decimal dilution). Computation of the estimated ninetieth percentile shall be obtained using NSSP Guidelines.

Conditionally Approved - Growing areas may be classified Conditionally Approved when they are subject to temporary conditions of actual or potential pollution. When such events are predictable, as in the malfunction of wastewater treatment facilities, non-point source pollution from rainfall runoff, discharge of a major river, or potential discharges from dock or harbor facilities that may affect water quality, a management plan describing conditions under which harvesting will be allowed shall be adopted by the Department prior to classifying an area as Conditionally Approved. Where appropriate, the management plan for each Conditionally Approved area shall include performance standards for sources of controllable pollution, e.g., wastewater treatment and collection systems, evaluation of each source of pollution, and means of rapidly closing and subsequent reopening areas to shellfish harvesting. Memorandums of agreements shall be a part of these management plans where appropriate.

Restricted - Growing areas shall be classified Restricted when sanitary survey data show a limited degree of pollution or the presence of deleterious or poisonous substances to a degree which may cause the water quality to fluctuate unpredictably or at such a frequency that a Conditionally Approved classification is not feasible. Shellfish may be harvested from areas classified as Restricted only for the purposes of relaying or depuration and only by special permit issued by the Department and under Department supervision. For Restricted areas to be utilized as a source of shellstock for depuration, or as source water for depuration, the fecal coliform geometric mean MPN of restricted waters sampled under adverse pollution conditions shall not exceed eighty-eight per one hundred milliliters and not more than ten percent of the samples shall exceed a MPN of two hundred and sixty per one hundred milliliters for a five tube decimal dilution test. For waters sampled under a systematic random sampling plan, the fecal coliform geometric mean MPN shall not exceed eighty-eight per one hundred milliliters and the estimated ninetieth percentile shall not exceed an MPN of two hundred and sixty (five tube decimal dilution). Computation of the estimated ninetieth percentile shall be obtained using NSSP guidelines.

Conditionally Restricted - Growing areas may be classified Conditionally Restricted when they are subject to temporary conditions of actual or potential pollution. When such events are predictable, as in the malfunction of wastewater treatment facilities, non-point source pollution from rainfall runoff, discharge of a major river, or potential discharges from dock or harbor facilities that may affect water quality, a management plan describing conditions under which harvesting will be allowed shall be prepared by the Department prior to classifying an area as Conditionally Restricted. Where appropriate, the management plan for each Conditionally Restricted area shall include performance standards for sources of controllable pollution (e.g., wastewater treatment and collection systems and an evaluation of each source of pollution) and description of the means of rapidly closing and subsequent reopening areas to shellfish harvesting. Memorandums of agreements shall be a part of these management plans where appropriate. Shellfish may be harvested from areas classified as Conditionally Restricted only for the purposes of relaying or depuration and only by permit issued by the Department and under Department supervision. For Conditionally Restricted areas to be utilized as a source of shellstock for depuration, the fecal coliform geometric mean MPN of Conditionally Restricted waters sampled under adverse pollution conditions shall not exceed eighty-eight per one hundred milliliters and not more than ten percent of the samples shall exceed a MPN of two hundred and sixty per one hundred milliliters for a five tube decimal dilution test. For waters sampled under a systematic random sampling plan, the fecal coliform geometric mean MPN shall not exceed eighty-eight per one hundred milliliters and the estimated ninetieth percentile shall not exceed an MPN of two hundred and sixty (five tube decimal dilution). Computation of the estimated ninetieth percentile shall be obtained using NSSP guidelines.

Prohibited - Growing areas are classified Prohibited if there is no current sanitary survey or if the sanitary survey or monitoring data show unsafe levels of fecal material, pathogenic microorganisms, or poisonous or deleterious substances in the growing area or indicate that such substances could potentially reach quantities which could render shellfish unfit or unsafe for human consumption.

BACKGROUND INFORMATION

This sanitary survey evaluates the current harvesting classification of shellfish growing waters designated as Shellfish Management Area 11 (Area 11). Area 11 consists of approximately 29,273 acres of shellfish

growing area habitat located in Charleston County, South Carolina. Area 11 consists of the Stono River and its tributaries including Elliott Cut, Abbapoola, Bass, Cinder, Green, Log Bridge and Rantowles Creeks and a portion of New Cut as well as the Kiawah River and its tributaries including Bryans, Captain Sams and Mullet Hall Creeks.

The harvesting classification of Area 11 prior to this sanitary survey was as follows:

Prohibited: (Administrative closure)

1. The waters of the Stono River with all adjacent marshland from 1000 feet south of the Highway 700 Bridge (Station 2) northward to Penny's Creek (Station 27);
2. Those waters of Elliott Cut and Wappoo Creek and all adjacent marshland.

Restricted:

1. Those waters of the Stono River and all adjacent marshland from Penny's Creek (Station 27) to marker 54 (Station 17);
2. Those waters of Bass Creek, from Station 32 to its headwaters, and all adjacent marshland;
3. Those waters of Cinder Creek and all adjacent marshland;
4. Those waters of Abbapoola Creek, from Station 6 to its headwaters, and all adjacent marshland.

Approved: All other waters in Area 11.

The shellfish industry in South Carolina is based primarily on the harvest of the eastern oyster (*Crassostrea virginica*) and hard clams, which include both the northern clam (*Mercenaria mercenaria*) and several small populations of the southern clam (*Mercenaria campechiensis*). Areas in South Carolina designated for commercial harvest by the South Carolina Department of Natural Resources (SCDNR) include State shellfish grounds, culture permits, and Kings Grant areas. The ribbed mussel (*Geukensia demissa*) is also harvested in South Carolina on a small scale by the general public for recreational harvest.

There are four State shellfish grounds within Area 11. There are two Public oyster grounds located at opposite ends of the Kiawah River. There are multiple culture permit leases throughout the southern portion of the area.

The shellfish-harvesting season in South Carolina normally extends from mid-September through mid-May. The SCDNR has the authority to alter the shellfish-harvesting season for resource management purposes and grant permits for year-round mariculture operations. Additionally, the South Carolina Department of Health and Environmental Control has the authority to prohibit shellfish harvesting when necessary to ensure that shellfish harvested in South Carolina waters are safe for human consumption.

POLLUTION SOURCE SURVEY

CHANGES IN POLLUTION SOURCES

Minor changes in pollution sources have occurred in Area 11 since the 2003 report.

SURVEY PROCEDURES

Shoreline surveys were conducted by the Trident District Shellfish Sanitation staff, by watercraft, vehicle and on foot, during the survey period and are ongoing. Extensive visual examinations of lands adjacent to the waters of Area 11 were conducted to determine potential sources of pollution entering shellfish growing waters.

POINT SOURCE POLLUTION

- A. Municipal and Community Waste Treatment Facilities** - There are no permitted wastewater facility outfalls within Area 11. The CPW wastewater plant located between sample points 11-27 and 11-02 has been closed and inactivated. There are, however, two waste treatment facilities within Area 11 that have been issued land application permits. One is on Kiawah Island (ND0017361) and the other is on Seabrook Island (ND0063347). There is also a Reverse Osmosis (RO) plant (SC0048186) located within Area 11. It is located on Seabrook Island and has been issued to Kiawah Resort\Cassique Golf Course. The discharge is only permitted to discharge concentrated salt residue. These three facilities are depicted on the attached Potential Pollution Source map.
- B. Industrial Waste (Discharges)** - There is one permitted industrial wastewater discharge located within the boundary of Area 11. The Three Oaks/Chicken Farm Mine (SCG730083) is a borrow pit located at the headwaters of Hut Creek. The permit was issued to address de-watering of the excavated area. This discharge is depicted on the attached Potential Pollution Source map.
- C. Marinas** – S.C. Regulation 61-47, Shellfish defines *Marina* as “any water area with a structure (docks, basin, floating docks, etc.) which is: 1) used for docking or otherwise mooring vessels; and, 2) constructed to provide temporary or permanent docking space for more than ten boats, or has more than 200 linear feet of docking space.” Area 11 supports a wide variety of boating facilities. There are two recreational marinas located on the Stono River. The Buzzards Roost and Stono marinas are on either side of the Highway 700 Bridge adjacent to Station 02. The marinas hold approximately 105 boats collectively, including some moorings within the river. Ross Marine has a small commercial marina holding approximately 15 boats. All three marinas offer pump out of on-board sewage. There are no commercial fisheries docking facilities within Area 11. Marina specific closure zone determinations have not been conducted in Area 11 however, a closure zone encompassed all marinas within the area. A survey, including depth profiles, stream width measurements, slip and dock linear footage, as well as other pertinent information, will be conducted at each Area 11 marina prior to December 31, 2004 in order to determine marina-specific closure zones.

- D. Radionuclides** - Sources of radionuclides have not been identified within Area 11, and radionuclide monitoring has not been conducted. No other sources of poisonous or deleterious substances have been identified within the area.

NONPOINT SOURCE POLLUTION

- A. Urban and Suburban Stormwater Runoff** - The shoreline survey conducted in Area 11 revealed the highest concentration of homes to be along the Stono River around Elliott Cut. The remaining portions of the Stono and the Kiawah Rivers have single-family residences along the shoreline. The shoreline survey has revealed that residential construction continues at a rapid rate, along the Stono River from Limehouse Bridge south to Goshen Point, and along both Bass and Cinder Creeks. A new Stono River Bridge is currently under construction and will be replaced in early 2004.

There are approximately 146 stormwater permits that have been issued within the Charleston County area. The permits are distributed throughout the area. The majority of the permits have been issued to construction sites and/or housing subdivisions. The remaining are for stormwater control for schools, churches and small businesses. These areas are depicted on the attached Potential Pollution Source Map. No dredge activities were conducted by the Army Corps of Engineers during the review period.

The uplands surrounding the shellfish growing waters of Area 11 consist of various soil textures. These have been defined by the United States Department of Agriculture (USDA), Soil Conservation Service (Charleston Co.1971) utilizing general classifications and descriptions. Although lands within Area 11 consist of numerous soil types, the area is generally comprised of Yonges-Hockley-Edisto soils, made up of low broad plains, which are randomly spaced drainage-ways that lead to tidal streams. The USDA (1971) further describes these soils as moderately well drained to poorly drained, nearly level soils that have a sandy surface layer and predominantly loamy subsoil.

- B. Agricultural Runoff** - There is one permitted agricultural facility located in Area 11. The facility is a small dog kennel located approximately 1.5 miles southwest of the Highway 700 bridge over the Stono River. The shoreline survey found a significant amount of pasture and farm land throughout Johns Island portion of the area. Two horse farms were noted in the area of Abbapoola Creek. The Clemson Extension Station located on Highway 17-South, utilizes various types of fertilizers on select crops on their property for research purposes.
- C. Individual Sewage Treatment and Disposal Systems** - In Area 11, the entirety of Johns Island along River Road is served by individual septic systems. Additionally, areas to the west of Main Road are not served by public sewer. There are sporadic septic tanks on Kiawah Island, most of them along the eastern end of the island. There have been no reported septic tank failures documented by the Division of Environmental Health. Each system is required to be inspected by the Division of Environmental Health, Trident Health District, and approved before final installation.

- D. Wildlife and Domestic Animals** - Area 11 supports a large population of domestic animals attributable to the number of private residences along the shores of the Stono River. There is a limited amount of wildlife on James and Johns Island due to the amount of urban sprawl or cultivated/pasture lands. An elaborate wildlife management program exists throughout Kiawah Island. The island has an intensive deer population control project and 35 bobcats are tracked with radio collars. A wildlife preserve is located at the northeast corner of the island that consists of several fresh and brackish ponds that drain into Cinder Creek. There are many small tidal creeks throughout the area. This creek system provides a conduit for animal fecal coliform bacteria to be transported to the adjacent growing waters.
- E. Boat Traffic** - Recreational boat traffic is moderate throughout the year. Commercial fisheries boats, ranging in size from 16 to approximately 50 feet, operate in the area in accordance with product demand. The northern portion of the Stono River (from Goshen Point to Elliott Cut) is part of the Atlantic Intracoastal Waterway. The waterway supports most of the recreational boat traffic.
- F. Hydrographic and Habitat Modification** - Hydrographic and habitat modification in estuarine areas requires both State and Federal approval. Portions of the AIWW require maintenance dredging. The U.S. Army Corps of Engineers utilizes designated tracts of land adjacent to the AIWW as dredge spoil sites.
- G. Marine Biotoxins** - Bivalve shellfish contamination from marine biotoxins has not been shown to be a human health concern within Area 11. The Department participates in a State Task Force on Toxic Algae and maintains a toxic algae emergency response team.

HYDROGRAPHIC AND METEOROLOGICAL CHARACTERISTICS

PHYSIOGRAPHY

Area 11 consists of the Stono River and its tributaries including Elliott Cut, Abbapoola, Green, Hut, Log Bridge and Rantowles Creeks and a portion of New Cut as well as the Kiawah River and its tributaries including Bass, Bryans, Captain Sams, Cinder and Mullet Hall Creeks. Due to minimal shoaling in both the Stono and Kiawah Rivers, dredging occurs on an infrequent basis. Freshwater flows into the area from Elliott Cut; however, most freshwater enters the area by way of overland runoff from rainfall events. High salinity ocean water enters the area from the Stono Inlet at the southeast corner of the area and Captain Sam's Inlet, which is shared by Kiawah and Seabrook Islands at the southwest corner of the area. The entire area is approximately 16 miles wide (west to east) and 19 miles long (north to south).

Tides - Tides in Area 11 are semidiurnal, consisting of two low and two high tides occurring each lunar day. Mean tidal ranges in the Stono River at Elliott Cut are 5.2 feet during normal tides and 6.8 feet during spring tides. Wind direction and intensity, as well as atmospheric pressure, typically cause variations in predicted tidal ranges.

Rainfall - Precipitation in Area 11 is heaviest during late summer and early autumn. Tropical storms and hurricanes occasionally produce extremely large amounts of rainfall. During winter months heavy rainfall events are uncommon, yet occasional intense thunderstorms associated with rapidly moving low-pressure systems generate heavy rains. Precipitation rarely occurs in the form of snow or ice. Spring weather patterns may be dynamic with associated thunderstorms and severe weather conditions.

The yearly rainfall average for a thirty-year period in Charleston, recorded at the Charleston Airport, is 52.14 inches. The 2003 precipitation total recorded at Plum Island on James Island was 56.8 inches. July through October had a total of 23.6 inches of rain, representing 42% of the total rainfall recorded for the year.

Winds - Prevailing winds along the central portion of the South Carolina coast are from the south and west during spring and summer and from the north during autumn and winter. Wind speeds are generally less than 15 miles per hour (mph); however, strong weather systems may generate winds in excess of 25 mph. Tropical storms and hurricanes occasionally occur.

River Discharges - Freshwater rivers do not discharge directly into Area 11. Freshwater influence is primarily due to rainfall.

WATER QUALITY STUDIES

Description of the Program

The Department currently utilizes a systematic random sampling (SRS) strategy within Area 11 in lieu of sampling under adverse pollution conditions. In order to comply with NSSP guidelines, a minimum of thirty samples are required to be collected and analyzed from each station during the review period. Sampling dates are computer generated prior to the beginning of each quarterly period thereby insuring random selection with respect to tidal stage and weather. Day of week selection criteria is limited to Mondays, Tuesdays and Wednesdays due to shipping requirements and laboratory manpower constraints. Sample schedules are rarely altered.

During July 1998, an updated shellfish water quality data scheduling and collection procedure was formalized. Samples utilized for classification purposes are limited to those samples collected in accordance with the SRS for a 36-month period beginning January 1 and ending December 31. This allows for a maximum of 36 samples per station, yet provides a six-sample cushion (above the NSSP required 30 minimum) for broken sample bottles, lab error, breakdowns, etc. This also allows each annual report's water quality data to meet the requirements for the NSSP Triennial Review sampling criteria.

884 SRS routine surface water quality samples (<1.0 ft. deep) were collected for bacteriological analyses from 26 active water quality sampling stations in Area 11 during the period 01/01/01 through 12/31/03. The samples were collected in 120 ml amber glass bottles, immediately placed on ice and transported to the South Carolina Department of Health and Environmental Control's Trident District Environmental Quality Control laboratory at North Charleston, South Carolina. An additional 120 ml water

sample was included with each shipment as a temperature control. At the laboratory, sample sets exceeding a 30-hour holding time or containing a temperature control in excess of 10 degrees C. were discarded (APHA, 1970).

Surface water temperatures were measured utilizing hand-held, laboratory-quality calibrated centigrade thermometers. Salinity measurements were measured in the laboratory using an automatic temperature compensated refractometer. Additional field data include ambient air temperature, wind direction, tidal stage and date and time of sampling. Tidal stages were determined by using Nautical Software's *Tides & Currents*, Version 2 (1996).

MONITORING RESULTS

Stations exceeding a fecal coliform geometric mean MPN value of 14 are 6A, 16, 18 and 27. No station exceeds a fecal coliform geometric mean MPN value of 88. Stations that exceed a fecal coliform MPN estimated 90th percentile value of 43 are 6A, 12, 16, 17, 18, and 27. Stations 34 and 35 are new stations with 23 samples per station. No station exceeds an estimated 90th percentile fecal coliform MPN value of 260.

A Fecal Coliform Bacteriological Data Summary Table is included in this report (See Table 2). Fecal coliform bacteriological raw data collected between 01/01/01 and 12/31/03 are included following the data summary table.

CONCLUSIONS

Based on review of fecal coliform bacteriological data and the pollution source survey, Area 11 appears to be impacted primarily by non-point source pollution.

NONPOINT SOURCE RUNOFF

Stormwater runoff appears to be the primary route of fecal coliform bacteria contamination into the area. Development of the surrounding upland is occurring along the upper Stono River, between the Limehouse Bridge and Goshen Point, and on the northern half of Kiawah Island, adjacent to Bass and Cinder Creeks. Natural vegetation is often removed from these waterfront properties. Overland runoff from rainfall and from residential outdoor water use could lower water quality by allowing fecal coliform bacteria to be transported more quickly to shellfish harvesting areas.

Analytical results from stations upstream of Station 32, located at the confluence of Bass and Cinder Creeks, historically indicated fecal coliform levels approaching Restricted area criteria. To help delineate potential pollution boundaries, two new stations were created in the 2001 Annual Report; Station 34 in Cinder Creek and Station 35 in Bass Creek. Currently both of these stations are in Approved status. Samples collected at Station 6A in Abbapoola Creek frequently indicate excessive fecal coliform concentrations. The variability of the data is evidenced by the elevated estimated 90th percentile value.

RECOMMENDATIONS

The shoreline survey and bacteriological data review of Shellfish Growing Area 11 indicate that classification boundary descriptions should be amended. Bacteriological water quality within the area appears to be relatively stable, with fifteen of twenty-six monitoring stations exhibiting slight statistical improvement (lower geometric means and/or estimated 90th percentile fecal coliform MPN values) from the 2003 annual report. The eleven remaining stations exhibit a slight downward oscillation.

The upland shores of the northern part of the Stono River, as well as Bass and Cinder creeks and the Kiawah River are being heavily developed. Stormwater runoff likely impacts shellfish water quality in these areas. The shoreline adjacent to the Stono River between the Highway 700 Bridge (Station 02) and Penny's Creek (Station 27) was the primary focus of shoreline survey activities during calendar year 2003. The CPW wastewater treatment plant that previously was permitted to discharge to the area has been closed and is now inactive. This portion of the Stono River, between the Buzzards Roost Marina and the Ross Marine facility is recommended for upgrade to a Restricted classification.

The shoreline survey also identified a significant amount of pasture and farm land throughout Johns Island portion of the area. Two horse farms were noted in the area of Abbapoola Creek. The area around Bass and Cinder Creek (Stations 34 and 35) exhibits improving water quality for the three-years and as a result is recommended for upgrade to an Approved classification. Additionally, the portion of the Atlantic Intracoastal Waterway and adjacent marshlands between stations 15 and 17 is recommended for downgrade to a Restricted classification. The following harvesting classification of Area 11 is recommended:

Prohibited: (Administrative closure)

1. Those waters of Elliott Cut and Wappoo Creek and all adjacent marshland.
2. Those waters of the Stono River from approximately 1000 feet south of the Stono Marina to approximately 1000 feet north of Buzzard's Roost Marina.
3. Those waters within approximately 1000 feet of the Ross Marine facility.

Restricted:

1. Those waters of the Stono River and adjacent marshlands, extending from the Prohibited closure around Buzzard's Roost Marina, northward to Marker 63 (Station 15), excluding the Ross Marine Prohibited closure zone.
2. Those waters of Abbapoola Creek and adjacent marshlands, from Station 6 to the headwaters.

Approved: All other waters in Area 11.

Station addition/deactivation/modification: None.

Analysis of sampling data for Area 11 demonstrates the probability of a significant impact from rainfall exceeding 4.00" in a 24 hour period. Therefore, a precautionary closure of Area 11 will be implemented following rainfall events of greater than 4.00" in a 24 hour period, as measured at the Charleston Commissioners of Public Works, Plum Island Wastewater Treatment Plant located on James Island. This methodology is associated with the concept of the Probable Maximum Precipitation (PMP).

PMP estimates for the coastal United States are published in a series of hydro-meteorological reports (HMRs) by the National Weather Service (*National Weather Service*). PMP estimates for South Carolina's growing areas are derived from HMRs 51, 52, and 53 (*National Research Council, 1985*).

Water Quality Sampling Stations Data

Shellfish Management Area 11

BACTERIOLOGICAL DATA

Data for each shellfish station listed in this report's "Fecal Coliform Bacteriological Data Summary Table" and in other shellfish reports, can be obtained through South Carolina's Department of Health and Environmental Control - Freedom of Information office at the address below.

Freedom of Information
2600 Bull Street
Columbia, SC 29201

Any explanation or clarity needed on the report's content can be obtained by contacting the preparer(s), and/or reviewer(s) listed on the cover page.
